

AIWindow — The Fastest Path to Enterprise AI Adoption

Add a security-verified AI chat capability to your business applications in just 5 minutes — no complex development required.

Enterprise AI Component for Businesses of Every Size

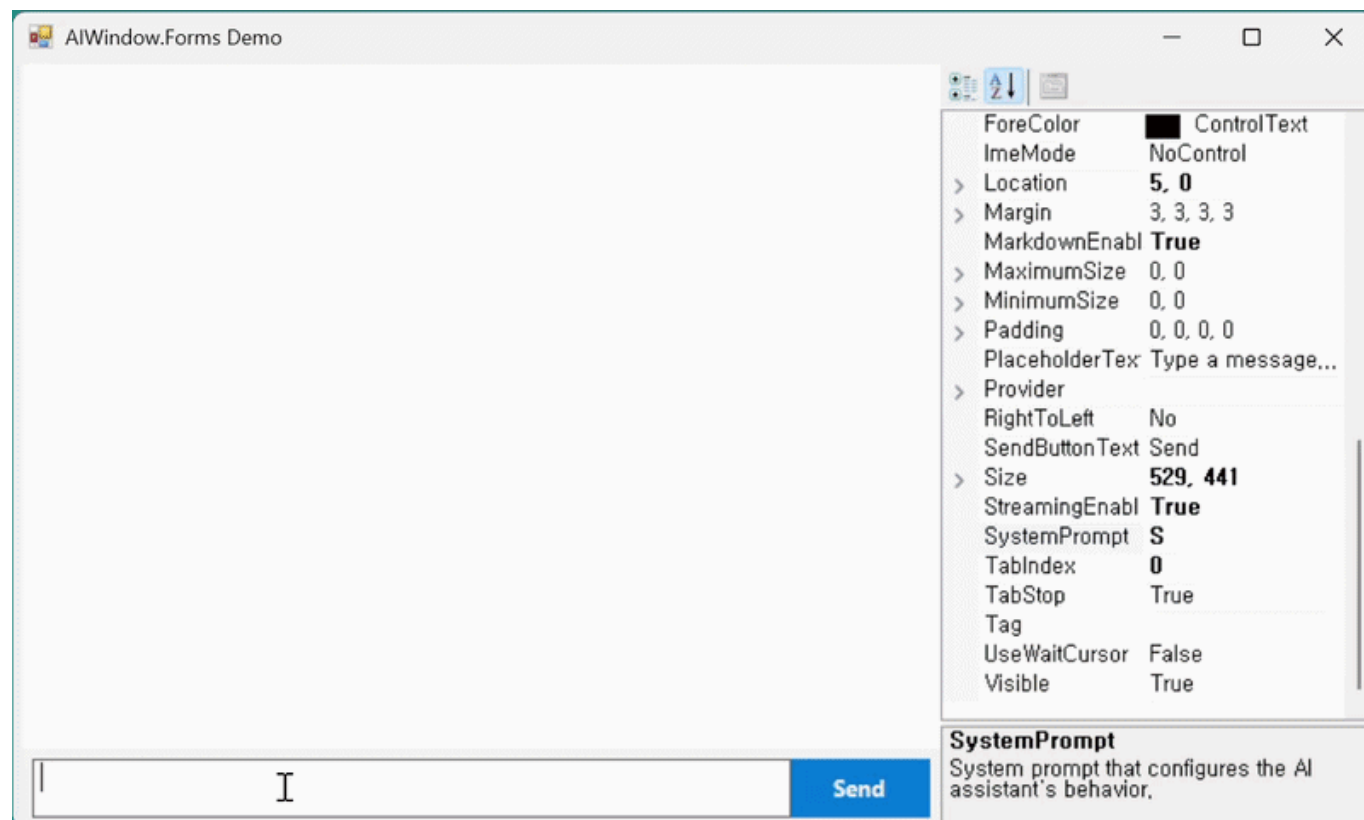

Bring *AI chat* to your business apps in 5 minutes.

Drop a verified AI chat component into your existing in-house desktop applications — no complex development required. Starting with WinForms and expanding across the entire Windows desktop landscape.

- **WinForms** · In Validation
- **WPF** · **Delphi** · **MFC** · **VB6** · Roadmap
- Compatible with **OpenAI** · **Azure** · **On-Prem LLM**

Live Demo — See it in action

Watch an AIWindow component being placed into an existing WinForms application via drag-and-drop, then activated as a fully working AI chat surface.

The Problem — The real barriers to enterprise AI adoption

Companies want to adopt AI, but security review, legacy compatibility, and development cost stop them before they start. Here are the five walls they keep hitting.

01 / Supply Chain · External supply-chain risk

A single AI library pulls in dozens of transitive dependencies. Each one becomes its own security review item.

02 / Legacy · Aging internal systems

Modern AI SDKs are hard to retrofit into legacy development environments that were never built for them.

03 / Cost · Heavy build cost

Building a chat UI in-house — from layout to streaming — easily takes months of engineering time.

04 / Security · Strict security review

External packages with unclear provenance rarely clear corporate security policy and stall at the gate.

05 / Compliance · Regulatory compliance

In finance, healthcare, and the public sector, audit logging and data protection are not optional — they're table stakes.

Why AIWindow — Zero external risk, safe AI adoption

AIWindow does not rely on third-party libraries. It's built on each platform's native framework and verified OS capabilities only — so your information security team can approve it quickly.

Aspect	Typical AI integration	AIWindow
Data transport	Add-on components requiring external review	Built on native OS capabilities
Data processing	Complex pipelines from third parties	First-party implementation, integrity intact
Rendering	Mix of external rendering libraries	Own renderer , fewer failure modes
Things to manage	Dozens of third-party packages	No external code
Security exposure	Latent flaws in upstream packages	Scoped to OS-level trust

Core Values — An intelligent chat solution that moves business outcomes

→ Connectivity · Reliable AI connectivity

Instantly connects to leading LLMs — OpenAI, Azure OpenAI, Anthropic — and any OpenAI-compatible self-hosted engine. Real-time streaming and automatic recovery, without dropouts.

→ Experience · User-centered interface

Intuitive conversation UI with high-quality rendering of Markdown, code blocks, and tables. Fully customizable to match your corporate brand.

→ Deployment · Fast deployment and operation

Drag and drop in the Visual Studio designer, configure a few options, and it just works. Audit logging, role-based access, and an admin console come standard.

Deployment — Three deployment models, pick the one that fits

From Cloud to fully air-gapped, choose based on data sensitivity and infrastructure constraints. All tiers share the same AIWindow API and admin console.

Tier 1 — Cloud · Standard deployment

Connects directly to public LLM APIs like OpenAI and Anthropic. Fastest to deploy, with immediate access to the latest models.

Best fit · Startups · Mid-market · General SaaS

Tier 2 — Hybrid · Selective isolation

Sensitive data stays on-premises; general traffic flows to the cloud. Strikes the right balance between cost and security.

Best fit · Scaling companies · Entering regulated markets

Tier 3 — On-Prem · Fully air-gapped

LLMs run entirely inside your infrastructure. No outbound traffic. Compatible with network-segregated and classified environments. Works with Ollama, vLLM, LM Studio, and more.

Best fit · Finance · Public sector · Healthcare · Defense

Our Philosophy — We know why new tech feels risky to adopt

Enterprises hesitate in front of new technology not out of laziness, but because they know a single bad adoption decision can haunt the operations team for five or ten years. Security teams can't sign off on unverified dependencies, and IT leaders don't want to pay to re-audit a new library every year.

— *AIWindow design principle*

That is exactly why AIWindow minimizes external dependencies and runs only on each platform's native framework. As the UI stack expands, the trust boundary your enterprise has to verify does not shift. One security review carries forward into the next adoption.

Roadmap — Every Windows desktop environment

Package	Target	Status
AIWindow.Forms	Existing desktop business applications	🕒 In Validation
AIWindow.Wpf	Large-scale management systems	○ Planned
AIWindow.Delphi	Mission-critical finance and manufacturing systems	○ Planned
AIWindow.Mfc	Legacy C++ enterprise applications	○ Planned
AIWindow.Vb6	Long-running internal business tools	○ Planned

Once an organization adopts AIWindow, expanding to the next UI stack does not require re-verifying the trust model from scratch. Same dependency profile, same native-framework principle, same security boundary. Minimizing the cost of adopting new technology is how AIWindow approaches multi-stack support.

Use Cases — Transforming AI work across industries

→ Finance · Knowledge assistant

AI answers complex internal policies and product details on demand. A safe environment with no sensitive data leakage, lifting team productivity.

→ Manufacturing · Equipment guidance

Ask AI on the floor instead of flipping through thick manuals. Drops into existing systems — no additional infrastructure required.

→ Healthcare · Decision support

AI parses vast clinical guidelines. Automatic record retention helps meet medical and other compliance requirements.

→ Public sector · Citizen service automation

Embedded in government workflow apps, AI drafts responses to citizen requests. Runs reliably even in fully air-gapped networks.

Get Started — Now accepting early access inquiries

A consulting program for enterprises evaluating AIWindow. We work through technical review, environment analysis, and license design together.
